Cumulative acres shown in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

High pressure will continue to amplify over the Western US today, bringing drying and warming conditions to the area, particularly across inland parts of the Pacific Northwest where temperatures are expected to be 10 to 15 degrees above normal. Highs in the 90's and lower 100's are forecast across the western half of the country, possibly reaching the lower 110's over southeast California and western Arizona. The hot temperatures will coincide with relative humidity levels in the single digits and teens in the afternoon and only poor recoveries expected at night. Conditions won't be quite as dry over the Desert Southwest where lingering monsoonal moisture will result in scattered afternoon thunderstorms. Gusty winds are expected in the afternoon throughout the Great Basin and into southeast Oregon, as well as near thunderstorms. Farther east, the main weather concern will revolve around the unwavering heat across the Southern Plains and Southeast. High temperatures in this area will peak in the 90s to 110F with relative humidity values dropping into the mid-teens to mid 20s. No strong winds are expected in these areas; however, wind gusts of 15-25 mph will be possible over Texas by afternoon. Numerous thunderstorms are also expected across the southeast and this could produce erratic outflow winds and new fire starts over the extremely dry and receptive fuels.
