Cumulative acres shown in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

Breezy west winds 10-20 mph with gusts 20-30 mph will develop across the Columbia Basin and northeast Washington amid RH of 15-25% creating areas of elevated conditions, primarily through the Cascade gaps. Temperatures will be cooler today and closer to normal in the northern half of the West, while temperatures remain slightly above normal in the Southwest and minimum relative humidity remains very low at 4-12% in Nevada to southwest Idaho. Smoke will still affect many areas in the northern half of the West but be less than the past two days. Isolated wet thunderstorms will develop in the Southwest today, with scattered showers and thunderstorms develop in the Colorado Rockies east of the Divide into the central Plains. Farther east, another day of breezy south winds, low relative humidity, and hot temperatures will support locally elevated fire weather conditions across the southern High Plains. Hot conditions will continue in the Lower Mississippi Valley and into the Southeast, while isolated showers and thunderstorms develop in South Georgia and Florida. Widespread wetting rain will fall in the Northeast, with the rain heaviest near the Catskills where flooding is possible. Increased winds are expected near the Hawai'i as Tropical Storm Fausto passes to the north of the islands.
